Lab01-Team Formation-Responsible AI Usage

Lab01-Team Formation-Responsible AI Usage

YY: 05

Exercise 1 - Team Formation

Discuss with your classmates to form a team of 5-7 members for the course project.

Fill in your team information using the provided link before.

Discuss with your group the strengths and weaknesses of each member, and agree on what each member will contribute to the project.

For the personal submission, write down the information of all members in your group, including:

- Student ID
- Full name
- Role in the project

Exercise 2 - Team Contract

A team contract sets clear expectations for how your team will work together, which helps you avoid conflicts and finish the project successfully. Discuss with your team and create a contract that every member agrees to.

Search the internet for examples, then customize them to fit your team. Do not copy a template unchanged. The contract must reflect your team's own decisions. A typical team contract for a course project should include the following sections:

- **Team information:** Team name, project title, and each member's full name, student ID, email, and preferred contact method.
- **Team goals and expectations:** The project goal, the target grade or quality level, and how much effort each member commits to.
- **Roles and responsibilities:** Each member's role (e.g., team leader, developer, tester, documentation, presenter), their strengths and weaknesses, and how roles may rotate or change.
- **Communication:** Communication channels (e.g., Zalo, Discord, email), expected response time, and who is the main contact for the instructor.
- **Meetings:** Meeting frequency, time, and place (in person or online), plus rules for agendas, taking meeting notes, arriving on time, and notifying the team of absences.
- **Work process and standards:** Task assignment and tracking tools (e.g., Trello, GitHub Projects), internal deadlines, Git workflow (branching, commit messages, code review), and quality standards for code and documents.
- **Decision making:** How the team decides (consensus or majority vote), and who has the final say when the team cannot agree.
- **Conflict resolution:** The steps for handling disagreements, such as talking directly, then involving the team leader, then asking the instructor.

- **Accountability and consequences:** What counts as a violation (e.g., missed deadlines, missed meetings, unequal contribution), how violations are handled (warning, task reassignment, reporting to the instructor), and how contribution is evaluated.
- **Academic integrity and AI use:** Rules on plagiarism, use of generative AI, and acknowledging external sources.
- **Changing the contract:** How the contract can be amended, and what percentage of members must agree.
- **Signatures:** The name, date, and agreement of every member.

Submit the team contract for this exercise.

Exercise 3 - Individual Proposal for the Course Project

Propose an original idea for your course project. Your submission must demonstrate independent thinking and must not simply replicate your group's project proposal.

You may either build upon your group's existing proposal or propose a project in an entirely different domain. If you choose to extend your group's proposal, your idea must incorporate at least one meaningful difference, such as a distinct problem domain, target audience, feature set, or technical approach.

Exercise 4 - Git

Task 1: Personal repository

- Create a personal private Git repository on GitHub, Bitbucket, or GitLab and add the instructor and TA as collaborators.
- In your report, write down the repository URL and the Git username you will use for all personal and group assignments in this course.

Task 2: Group repository

- Together with your group, create a private group repository and add all group members, the instructor, and the TA.
- In your report, write down the group repository URL and a table of each member's student ID, full name, and Git username.

Each member's Git username must not be changed during the course.

There is an AI-generated Git/GitHub tutorial in the attachment. You may use it as a reference to help with your assignments.

Exercise 5 - Responsible AI Usage

AI is an essential part of daily life and work, not only for technical people like us, but also for non-technical people.

We must use AI carefully. It should not be used only to cheat or to replace our lab work, but to enhance our abilities. We also take responsibility for what our AI generates.

Read the provided documents and write a report that answers the following questions:

- Have you used AI before?
- Do you have any experience or tips for using AI?
